Press Release
March 28, 2017

First Swiss eluminocity charging station for EVs installed in Zurich.

MUNICH. In March 2017 the charging infrastructure in Canton Zürich was expanded with eluminocity charging stations. This is the first installation of eluminocity in Switzerland. Two charging stations were just recently launched with another one following shortly. The approach is unique: Consisting city infrastructure was used to expand the charging points as regular street lights were transformed into charging station with eluminocity's retrofit charging solution. Now it is possible that two hybrid or EVs can charge single-phase with an output of 3.7 kW. The project in Kanton Zürich and in cooperation with BMW and the electric utility company of Kanton Zürich EKZ contributes to the extension of charging infrastructure for electric vehicles. The test phase lasts for two years. During this time period owners of any type of electric vehicles can charge for free. The location Färbiplatz was evaluated suitable for the test phase as it is a new area for working and living in Schlieren, Kanton Zürich. The charging station of eluminocity marks the start of a long-term project, in which BMW is motivated to expand the charging net to further parts of Switzerland.

eluminocity developed in cooperation with the BMW Group the modular product system "Light & Charge" to transform street lights into charging stations for electric vehicles. The innovations of the eluminocity portfolio are essential elements of an intelligent infrastructure - for applications in the city and for every modern company. The eluminocity products are preferred choices in the public and semi-public space. Especially the Charging-Module serves as a modern and environmentally-friendly service and is implemented into the urban infrastructure as well as installed on customer and employee parking lots of industrial and commercial buildings and the hotel sector. The LED-Module helps in reducing energy costs and improving safety in the city and on parking areas. The Connect-Module supports, among other things, the intelligent lighting control, the car-park management and the analysis of environmental factors.
